Safety Instructions

For proper and safe operation, be sure to carefully read the Instruction Manual, "Safety Instructions" and "Operating Instructions" before starting to use the Transfer Switch.

- Install the transfer switch in the vertical position as indicated by the UP marking. Failure to install in the correct orientation may lead to malfunction.
- Provide the arcing space specified in the catalog around the transfer switch. Arc coming into contact with a metallic object at shutdown can cause accidents.
- Do not allow a voltage drop of more than 4 percent for the control circuit, including the control wiring and contacts of control contactors. Large voltage drop can cause malfunction or abnormal heating.
- Design the circuit in such a way that no simultaneous excitation command or continuous alternate excitation command is given to the control coils. Incorrect circuit design can cause malfunction or abnormal heating.
- Be sure to install a fuse for protecting the control circuit. The fuse capacity should be 40 to 50 percent of the rated coil current.
- When the transfer switch is to be used with an induction motor, provide a circuit to protect the switch from abnormal inrush current caused at switching. Also the switch to be used must have a sufficient capacity.
- When used with a transformer, capacitor or incandescent lamp, select the transfer switch that has a capacity large enough to withstand expected transient inrush current.

TRANSFER SWITCHES

Instantaneous Excitation & Mechanical Holding Type

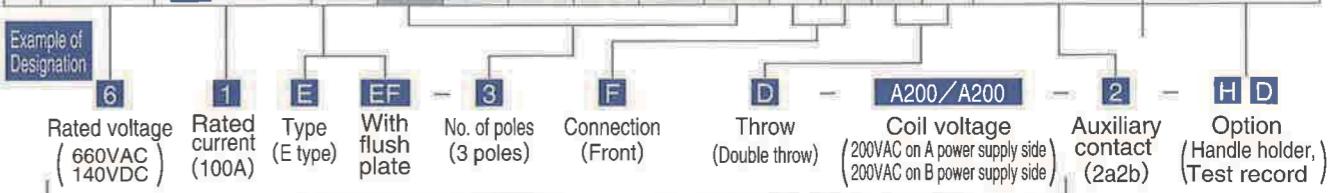

■Features

- Small size and light weight
- Control circuit and main circuit housed in a casing
- Dedicated auxiliary contact built in for instantaneously cutting off control auxiliary relay
- Terminal covers provided for control circuit and main circuit (Terminal cover for main circuit: Front type only)
- Environment friendly contacts free of cadmium
- A wide range of models to select from for your applications
- The main contacts of each phase (contacts of A power supply and B power supply) have each arcing space.

■Model Designation and Selection

- | | | |
|--|---------------------|---|
| | Standard model | (Models immediately available to order) |
| | Semi-standard model | (Models produced on standard lines and so available in short lead time) |
| | Non-standard model | (Models produced to individual orders) |

Rated voltage	Rated current	Type	No. of poles (Neutral pole of N3, N4 : earlier make and later break)					Connection		Throw		Auxiliary circuit (auxiliary contact)	Option

■Standard accessories

- Operation handle
 - Control circuit terminal cover
 - Main circuit terminal cover (Front only)
 - Main circuit terminal bolt (400A or below)
- NOTES 1. Standard control coil voltages are 100/110VDC, 100/110VAC and 200/220VAC. Other voltages are available to individual orders.
2. Even with the back connection type, front wiring is used for the control circuit and auxiliary circuit.
3. The electrical and mechanical interlocks assure error-free operation both in auto and manual mode.

Instructions on Use

standard : JEM1038 · JEM1465 · IEC60947-6-1 · JIS C-8325 · UL1008 · CCC (NE TYPE)

1 Installation

1-1 Environment of installation

- Do not install the transfer switch in an environment of high temperature or high humidity or in an atmosphere containing dust or harmful gases.
 - The environmental requirements are in compliance with JEM 1038 (1990) as follows:
 - (1) Altitude : 2000m or below
 - (2) Ambient temperature : -5°C~40°C (average temperature of a day : 35°C or below)
 - (3) Relative humidity : 45% ~ 85%RH
 - (4) No abnormal vibration or shocks
 - (5) Atmosphere free from excessive water vapor, oil vapor, smoke, dust, salt, corrosive material, etc.
 - About use under conditions other than specified, contact Kyoritsu Keiki for advice.
 - The approximate reduction rate of the rated operating current for use at high temperatures above 40°C is as follows:
- | | |
|--------------|--------------|
| 50°C ... 90% | 60°C ... 80% |
|--------------|--------------|

1-2 Positioning

- Install the transfer switch according to the UP marking.
For installation in orientation other than specified, consult Kyoritsu Keiki.
- Attach the mounting base on a vertical surface, and install the transfer switch with the control circuit, main circuit and auxiliary circuit in this order from right to left.

2 Control Circuit

2-1 Pickup voltage

- The control coils of the transfer switch are an instantaneous excitation type and of short time rating. The pickup voltage range is as follows:

AC control	80 to 120% of rated voltage
DC control	80 to 130% of rated voltage
- Make sure that the control voltage does not drop below 80 percent of the rated voltage at the control terminals of the transfer switch.
- In order to prevent action failure, make certain that the voltage drop is less than 4 percent in the wiring from power supply to the terminals of the control circuit, including the contacts of the excitation contactor.

2-2 Control circuit

- Be sure to fit a fuse for coil protection in the control circuit.
- Although the switching operation is completed within 0.3 seconds, give a signal of 0.5 seconds or longer so as to ensure reliable operation.
- Be sure to provide an interlock circuit so as to make sure that no simultaneous excitation commands, continuous alternate excitation commands or simultaneous excitation commands for the same direction work on the control coils.
- The transfer switch is of such design that on completion of operation the control current is turned off by the internal contact. Use of any external auxiliary contact can cause failure of the operation.
- Where there is a dropper circuit provided for control power supply (DC), connect the control power supply to the input side of the dropper circuit. (Never connect it to the output side.)
- For sequence and control, select proper contactors and sensors with full understanding of their performance.
- The exciting coils have a built-in thermal protector as a protection against continuous energization. (For AC operation)
- The reset time when the thermal protector has operated is 15 to 60 minutes. Before being reset, the transfer switch will not work even when a switching signal is given.

2-3 Coil protection fuse

- When introducing fuse for coil protection, select a fuse whose capacity is 40 to 50% of the rated coil current and use it solely for the transfer switch (excl. control contactor, etc.). Too large fuse capacity will not serve the purpose of coil protection.
- Kyoritsu is positive of the absolute safety of the operation of SSK Series. Even if any improper control circuit or parts are used, the control coil of SSK Series, which is of short-time rating, contains a thermal protector within to prevent the burnout or melting of the coil thus assuring absolute safety.

2-4 Control contactor

- The control contactor must be highly reliable to always ensure normal operation of the transfer switch. That is, the contactor to be used must have a switching capacity large enough to withstand the induction load of the control coil.
- For direct control with the contacts of undervoltage relay⁽²⁷⁾, built-up voltage relay⁽⁸⁴⁾ and timer^(T), use a relay whose contact capacity is larger than the control current of the transfer switch. And use a built-up voltage relay⁽⁸⁴⁾ whose pickup voltage is 80% or above. (Use of a general-purpose relay, whose pickup voltage is below 80%, can cause operation failure or other trouble.)
- The power relay and built-up voltage relay, when used, will cause repetition of switching if their operation and reset timings are set extremely short. Therefore set proper operation and reset timings upon confirming the load and power supply conditions.
- Do not use ordinary miniature relays or the like as a making auxiliary relay. If they are used, operation failure may result from the bouncing or voltage drop at the contacts. Therefore select an auxiliary relay with sufficient capacity. You are advised to use an auxiliary relay of the contactor type.

2-5 Capacity of control transformer

- The capacity of the control transformer must be equal to or larger than the value calculated by the following equation:

$$\square \quad VA = \text{Control voltage} \times \text{Control current} \times 0.6$$

3 Main Circuit

3-1 Main circuit connection

- Select wires to be connected which have proper current capacity.
- When tightening, take care not to apply excessive stress to the terminals.

3-2 Arcing space

- When installing the transfer switch, be sure to provide arcing space as indicated in "Overall Dimensions". Arc at the time of breaking, when it comes in contact with any other device or metal body, can lead to some accident.

3-3 Use with induction motor

- An induction motor, when used with the transfer switch, turns into a generator at the moment of switching when the input becomes zero, thus generating a voltage. If another voltage 180 degrees out of phase with the generated voltage should be inputted, an abnormally large current will flow and cause a fused contact of the switch. To prevent such an accident, provide an appropriate circuit and select an appropriate transfer switch of sufficient capacity.

3-4 Use with transformer

- A transient inrush current is generated at the turning-on of power to a transformer. The current can be about 20 times as large as the normal current. Therefore, select a transfer switch of a capacity large enough to withstand such a current.

3-5 Use with capacitor

- An inrush current may occur when the transfer switch is used with a capacitor as the load. When two or more capacitors connected in parallel are switched on in sequence, a voltage equalization current between the capacitors is added to the inrush current from the power supply. Select a transfer switch of appropriate capacity in consideration of such currents.

- A capacitor circuit, generally speaking, should be provided with a series reactor (6% of the capacitor reactance).

3-6 Use with electric lamp

- When an electric lamp is the load, prepare for inrush currents by selecting a transfer switch of appropriate capacity.

The transient inrush current of an incandescent electric lamp is about 10 times as large as the rated current and it becomes a steady current within about 0.1 second.

- With a fluorescent lamp, the starting current, about 10 times the rated lamp current, flows for about 2 seconds, although that varies with the presence or absence of a stabilizer circuit or power-factor regulating capacitor.

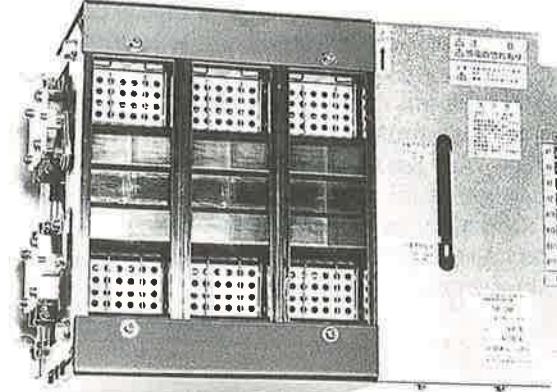

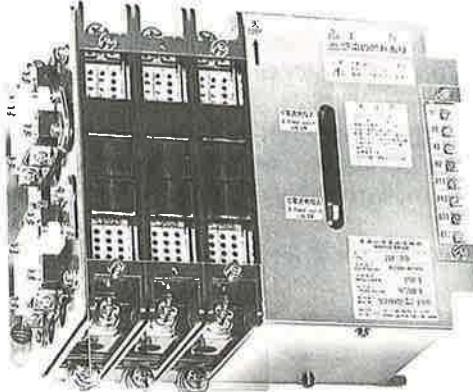

- A mercury lamp is provided with a stabilizer of general type, low starting current type or constant power type. With the general type or the low starting current type, the starting current of about 1.8 times the steady current flows for about 5 minutes.

4 Manual Operation

- Manual operation of the transfer switch is to be performed for checks. Never conduct this checking while power is being supplied.
- Be sure to turn off the main circuit and control circuit before manual operation.

1 Features

- 250VAC rating
- Small-size and lightweight
- A broad variety of models

4 Operation Time Chart (30A~1600A)

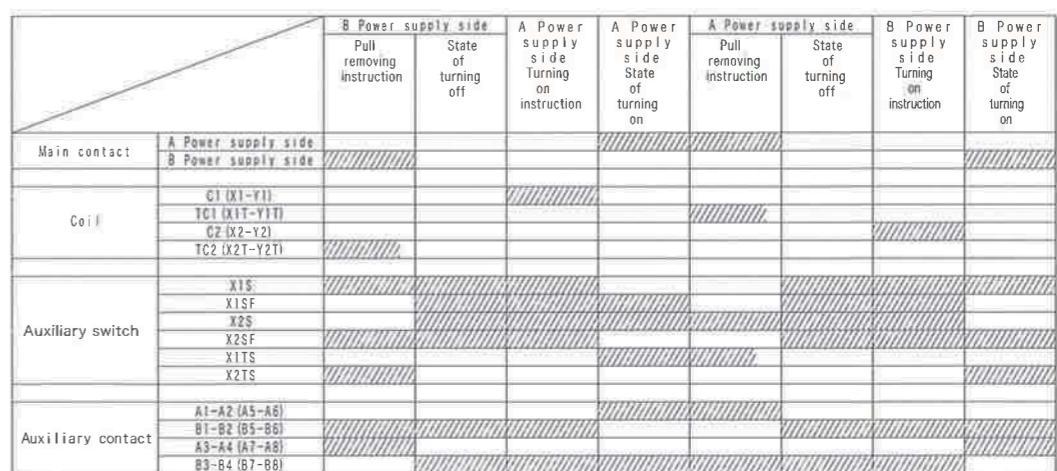

5 Example of Typical Circuit (30A~1600A) A general case of switching

(Circuit where no excitation is performed after completion of switching 27X and 84X of auxiliary relay)

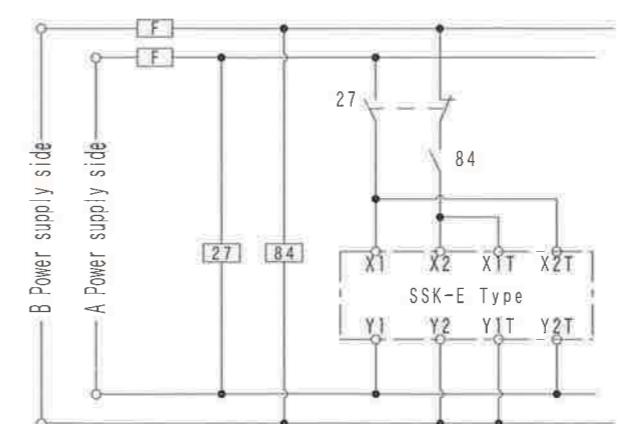

27 Undervoltage relay
84 Built-up voltage relay

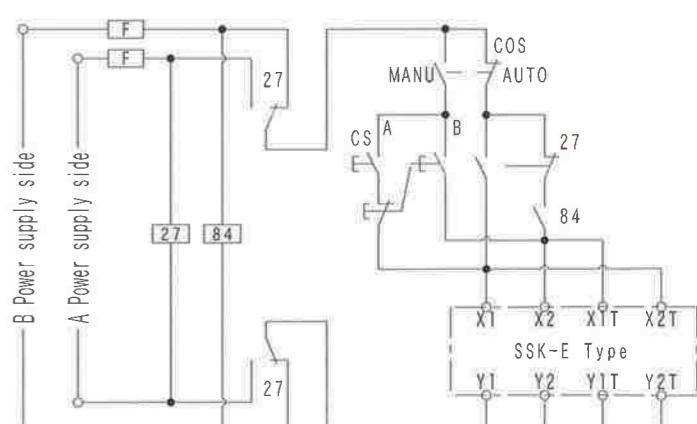

6 Operation Time Chart (2000A~5000A)

7 Example of Typical Circuit (2000A~5000A)

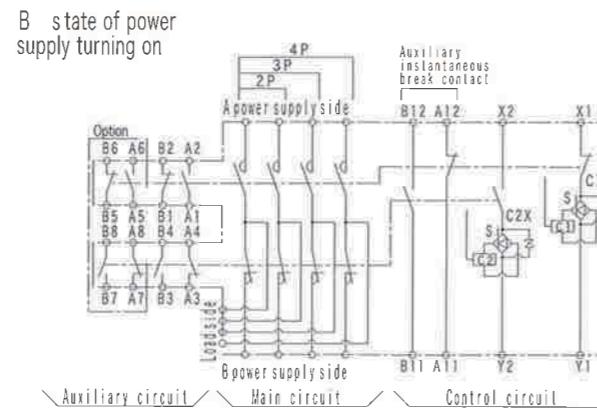

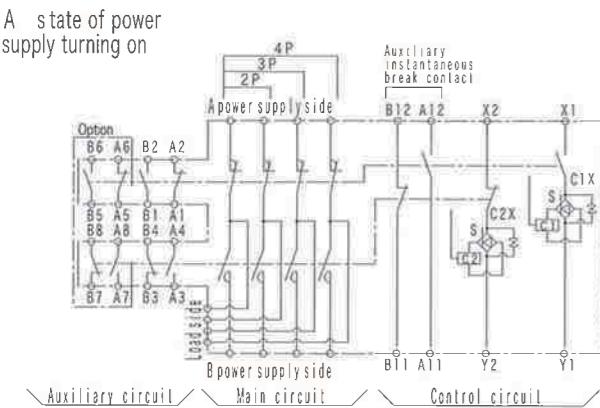

8 AUTO-MANU switch introduced (2000A~5000A)

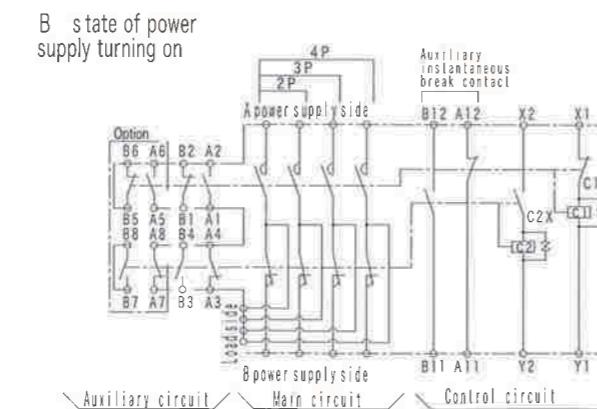

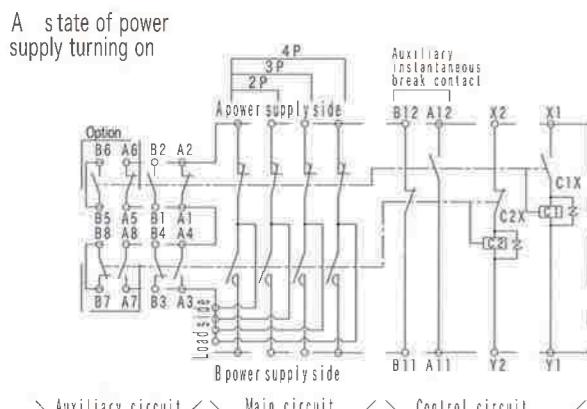

9 Circuit Diagrams (30A~1600A)

- The diagrams below represent 4P and auxiliary circuit 4a4b.
 - For single-phase 3-wire [N3] , the neutral pole is in the middle. (N marking on the transfer switch)
 - For 3-phase 4-wire [N4] , the neutral pole is on the right. (N marking on the transfer switch)

Circuit for AC Control

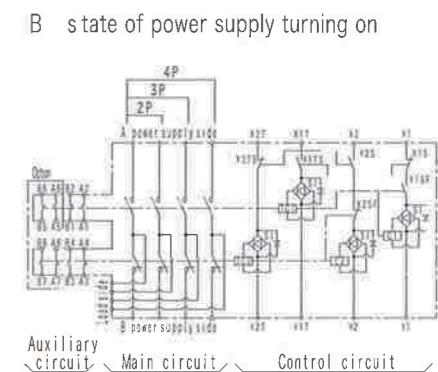

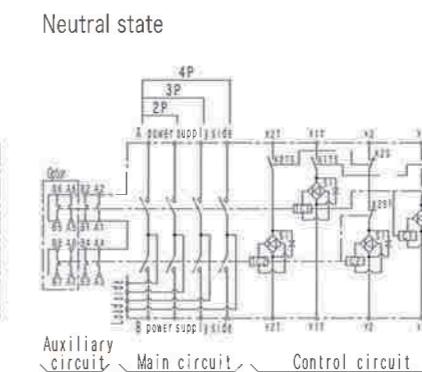

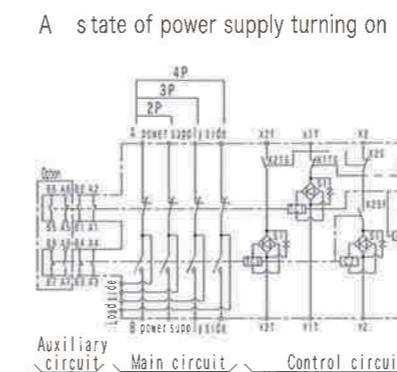

Circuit for DC Control

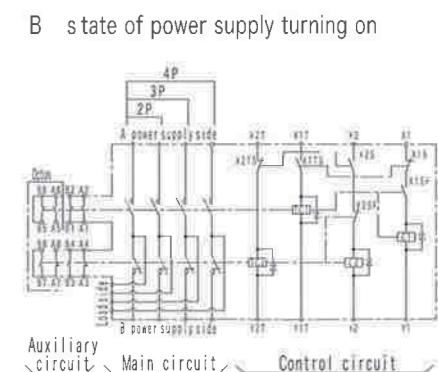

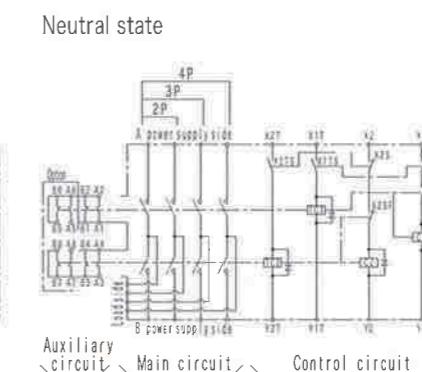

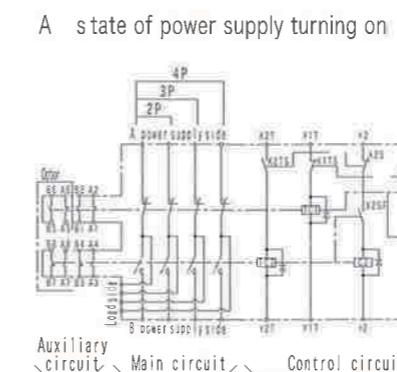

10 Circuit Diagrams (2000A~5000A)

- The diagrams below represent 4P and auxiliary circuit 4a4b.
 - For single-phase 3-wire [N3], the neutral pole is in the middle. (N marking on the transfer switch)
 - For 3-phase 4-wire [N4], the neutral pole is on the right. (N marking on the transfer switch)

Circuit for AC Control

Circuit for DC Control

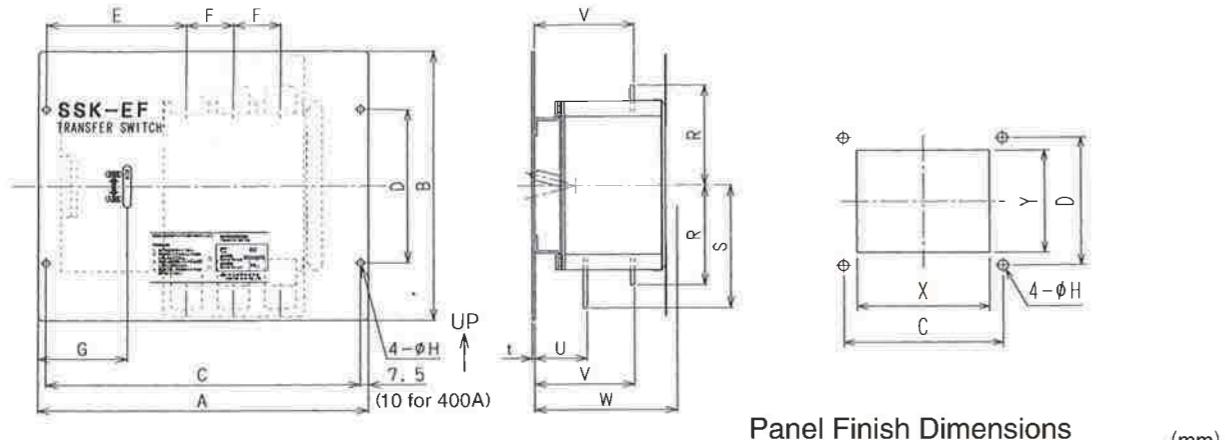

1 Features

- Flush plate provided
- 660VAC rating
- Mounted on flush plate at delivery
- Manual operation possible for both front and back types

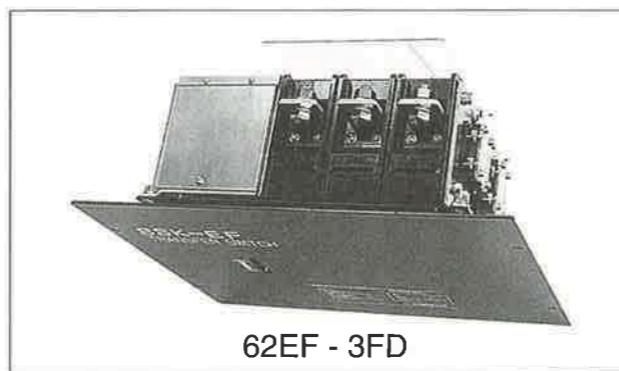

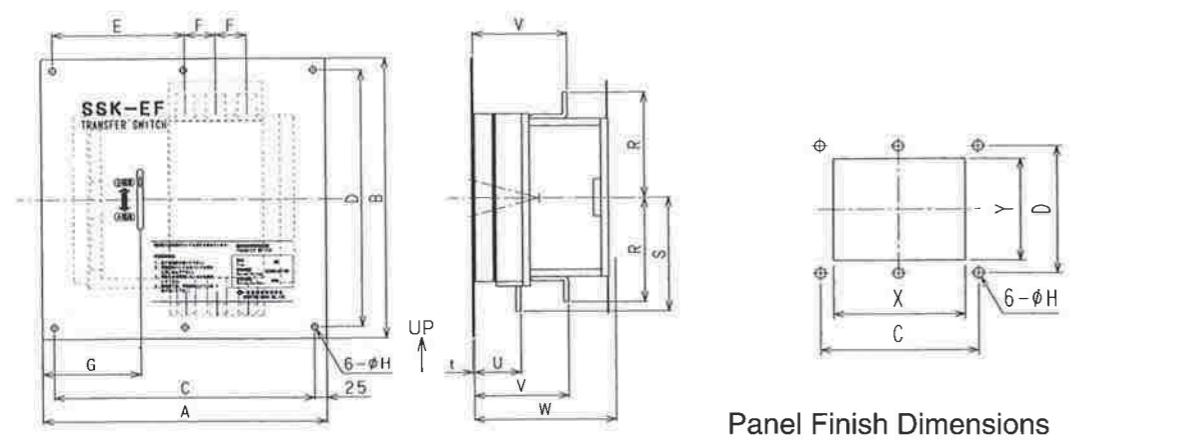

2 The rated specifications are the same as those for the E type

3 Overall Dimensions

30A~400A

600A~1600A

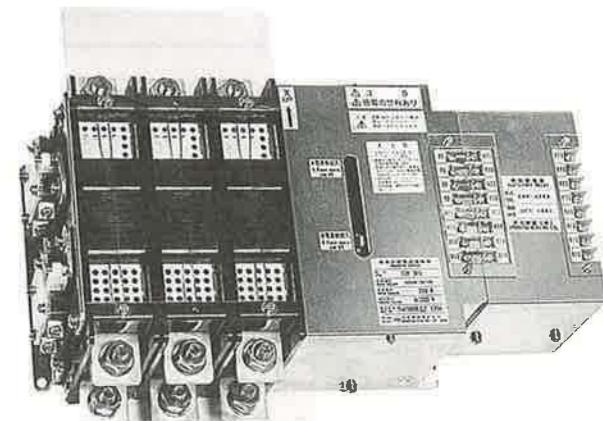

1 Features

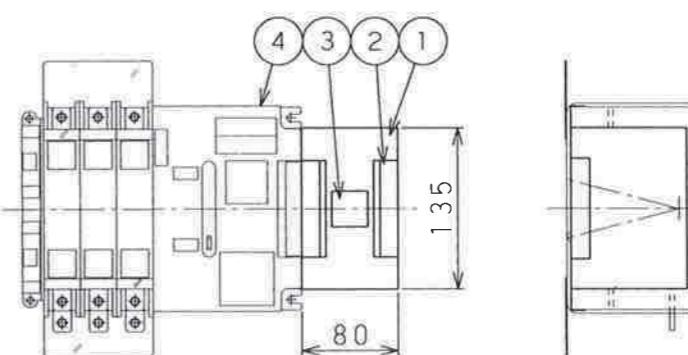

- Auxiliary relay panel for 30A ~ 1600A only
- Mounted on switch body

2 Specifications

Rated voltage	250VAC
Rated current	30A
Control current	100VDC 0.08A 100VAC 0.1A 200VAC 0.05A
Coil insulation class	B class (continuous)
Withstand voltage	Main circuit 2500V AC 1 minute (50/60Hz) Control circuit 2000V AC 1 minute (50/60Hz)

- J, K, and L apply to the back type (B).

4 Control Circuit Wire Size Table

- This table shows the wire size when one 2p or 3p model is to be operated.
- The specified wire length is the total length(line reciprocity).
- The specified wires are 2mm² or thicker.
- When two or more models are to be operated, calculate the wire size so that the control wire has a sufficient capacity.

Safety Instructions**CAUTION**

For proper and safe operation, be sure to carefully read the Instruction Manual, "Safety Instructions" and "Operating Instructions" before starting to use the Transfer Switch.

- Install the transfer switch in the vertical position as indicated by the UP marking. Failure to install in the correct orientation may lead to malfunction.
- Provide the arcing space specified in the catalog around the transfer switch. Arc coming into contact with a metallic object at shutdown can cause accidents.
- Do not allow a voltage drop of more than 4 percent for the control circuit, including the control wiring and contacts of control contactors. Large voltage drop can cause malfunction or abnormal heating.
- Design the circuit in such a way that no simultaneous excitation command, continuous alternate excitation command or simultaneous excitation command in the same direction is given to the control coils. Incorrect circuit design can cause malfunction or abnormal heating.
- Be sure to install a fuse for protecting the control circuit. The fuse capacity should be 40 to 50 percent of the rated coil current.
- When the transfer switch is to be used with an induction motor, provide a circuit to protect the switch from abnormal inrush current caused at switching. Also the switch to be used must have a sufficient capacity.
- When used with a transformer, capacitor or incandescent lamp, select the transfer switch that has a capacity large enough to withstand expected transient inrush current.

TRANSFER SWITCHES

Instantaneous Excitation & Mechanical Holding Type with OFF Position

Features

- Small size and light weight
- Neutral stop possible
- Control circuit and main circuit housed in a casing
- Terminal covers provided for control circuit and main circuit (Terminal cover for main circuit: Front type only)
- Environment friendly contacts free of cadmium
- A wide range of models to select from for your applications
- The main contacts of each phase (contacts of A power supply and B power supply) have each arcing space.

Model Designation and Selection

- | | | |
|--|----------------------------|---|
| | Standard model | (Models immediately available to order) |
| | Semi-standard model | (Models produced on standard lines and so available in short lead time) |
| | Non-standard model | (Models produced to individual orders) |

Standard accessories

- Operation handle
- Control circuit terminal cover
- Main circuit terminal cover (Front only)
- Main circuit terminal bolt (400A or below)

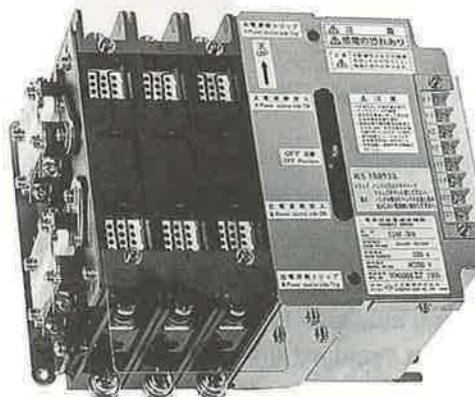

NOTES 1. Standard control coil voltages are 100/110VDC, 100/110VAC and 200/220VAC.

Other voltages are available to individual orders.

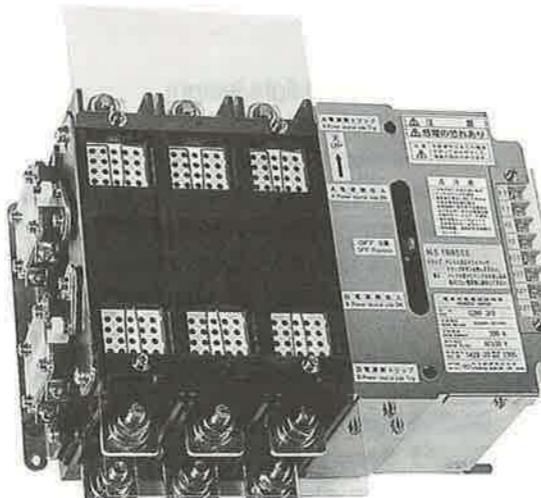

2. Even with the back connection type, front wiring is used for the control circuit and auxiliary circuit.
3. The electrical and mechanical interlocks assure error-free operation both in auto and manual mode.

1 Features

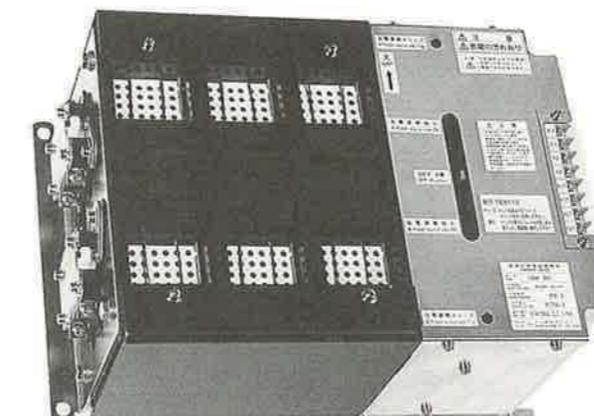

- Capable of neutral stop
- Small-size and lightweight
- A broad variety of models

Safety Instructions

CAUTION

For proper and safe operation, be sure to carefully read the Instruction Manual, "Safety Instructions" and "Operating Instructions" before starting to use the Transfer Switch.

- Install the transfer switch in the vertical position as indicated by the UP marking. Failure to install in the correct orientation may lead to operation failure.
- Provide arcing space as specified in the catalog around the transfer switch. Arc coming into contact with a metallic object at breaking can cause accidents.
- The exciting coils of this transfer switch is of the short-time rating. Do not allow a voltage drop of more than 4 percent for the exciting circuit, including the wiring and contacts of exciting contactors. Otherwise, "Minimum pickup voltage" (85%) - "Voltage drop" (4%) = 81%. Large voltage drop can cause operation failure and consequently abnormal heating of coils.
- Design the circuit in such a way that no simultaneous excitation command or continuous alternate excitation command is given to the two exciting coils. Incorrect circuit design can cause malfunction, abnormal heating of coils or fusion of main contacts.
- Be sure to install a fuse for protecting the control circuit. The fuse capacity should be 40 to 50 percent of the rated coil current.
- When the transfer switch is used for overlapped switching between two power supplies, be sure to use it with the phase of the two power supplies adjusted.

- Do not use the overlap transfer switch for the switching between stand-by power supply system for emergency use and commercial power supply system. (The Guide Book of Electrical Equipment, 43-2)
- The electrical angle of phase difference at switching must be less than 7 degrees.
- The voltage difference between the two power supply systems at switching must be less than five percent.
- The frequency difference between the two power supply systems at switching must be less than 0.2 Hz.
- Transient current flows according to the phase difference and voltage difference, so that consideration must be given to the resistance of the power supply system to the transient current.

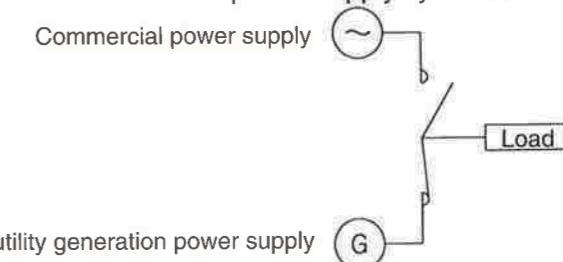

Uses

- This transfer switch (contactor is capable of switching between different types of power supply systems without any instantaneous power break.
- The transfer switch can replace the functions of NFB, ACB, etc.
- The merits the LE type transfer switch provides include:
 - ! More efficient use of space
 - " Easy connection of main circuit
 - # Simplification of control circuit

Examples of Usage

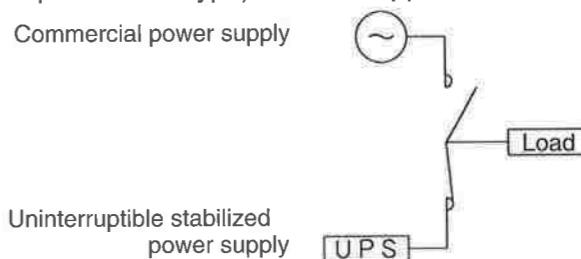

- (1) **Switching between non-utility generation power supply system and commercial power supply system without any instantaneous power break**

You can use the overlap transfer switch for instantaneous switching between non-utility generation power supply system and commercial power supply system.

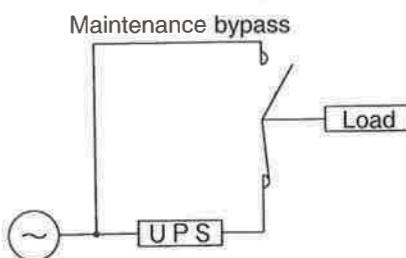

- (2) **Switching between uninterruptible stabilized power supply system and commercial power supply system without any instantaneous power break**

The LEF type (overlap time fixed type) suits this application.

- (3) **Bypass switching for maintenance of uninterruptible stabilized power supply system**

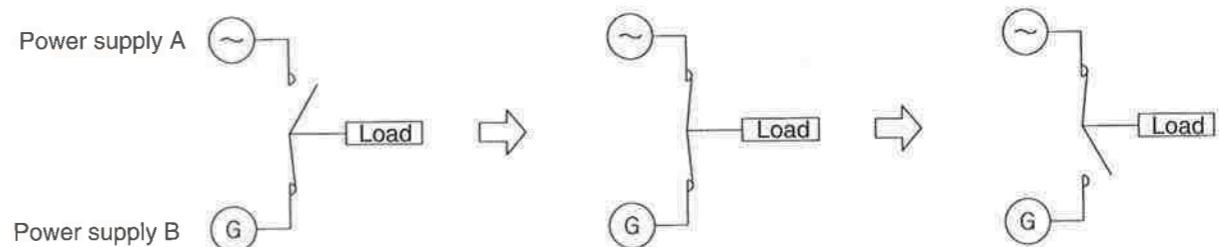

Example of Switching Operation

Phases are matched between the two power supply systems while power is being supplied from B.

Overlapped condition

Power is supplied from A.

Instructions for Use

standard : JEM1038 · JEM1465 · IEC60947-6-1 · JIS C-8325 · UL1008 · CCC (NE TYPE)

1 Installation

1-1 Environment of installation

- Do not install the transfer switch in an environment of high temperature or high humidity or in an atmosphere containing dust or harmful gases.
- The environmental requirements are in compliance with JEM 1038 (1990) as follows:
 - (1) Altitude : 2000m or below
 - (2) Ambient temperature : -5°C ~ 40°C (average temperature of a day : 35°C or below)
 - (3) Relative humidity : 45% ~ 85%RH
 - (4) No abnormal vibration or shocks
 - (5) Atmosphere free from excessive water vapor, oil vapor, smoke, dust, salt, corrosive material, etc.
- About use under conditions other than specified, contact Kyoritsu Keiki for advice.
- The approximate reduction rate of the rated operating current for use at high temperatures above 40°C is as follows:

50°C ... 90%	60°C ... 80%
--------------	--------------

1-2 Positioning

- Install the transfer switch according to the UP marking.
For installation in orientation other than specified, consult Kyoritsu Keiki.
- Attach the mounting base on a vertical surface, and install the transfer switch with the control circuit, main circuit and auxiliary circuit in this order from right to left.

2 Control Circuit (LEF Type)

2-1 Pickup voltage

- The exciting coils of the transfer switch are an instantaneous excitation type and of short time rating.
The pickup voltage range is as follows:

AC control	85 to 110% of rated voltage
DC control	85 to 130% of rated voltage
- Make sure that the exciting voltage does not drop below 85 percent of the rated voltage at the terminals of the exciting coils.
- In order to prevent action failure, make certain that the voltage drop is less than 4 percent in the wiring from power supply to the terminals of the control circuit, including the contacts of the excitation contactor.

2-2 Control circuit

- Be sure to provide the exciting circuit with a fuse for coil protection.
(40 to 50% of the rated current of the coil)
- Although the switching operation is completed within 0.3 seconds, give a signal of 0.5 seconds or longer so as to ensure reliable operation.
- Form the circuit in such a way that no simultaneous excitation commands or continuous alternate excitation commands work on the exciting coils.
- The exciting coils have a built-in thermal protector as a protection against continuous energization.
(For AC operation)
- The reset time when the thermal protector has operated is 15 to 60 minutes. Before being reset, the transfer switch will not work even when a switching signal is given.

The transfer switch is of such design that on completion of operation the control current is turned off by the internal contact.

Use of any external auxiliary contact can cause failure of the operation.

- Where there is a dropper circuit provided for control power supply (DC), connect the control power supply to the input side of the dropper circuit. (Never connect it to the output side.)
- For sequence and control, select proper contactors and sensors with full understanding of their performance.

2-3 Coil protection fuse

- When introducing fuse for coil protection, select a fuse whose capacity is 40 to 50% of the rated coil current and use it solely for the transfer switch. Too large fuse capacity will not serve the purpose of coil protection.

2-4 Control contactor

- The control contactor must be highly reliable to always ensure normal operation of the transfer switch. That is, the contactor to be used must have a switching capacity large enough to withstand the induction load of the exciting coil.
- Do not use an ordinary miniature relay or the like as an auxiliary relay for excitation. If they are used, operation failure may result from the bouncing of the contacts and the subsequent contact fusion or voltage drop. Therefore select an auxiliary relay with sufficient capacity. You are advised to use the contactor to be purchased from Kyoritsu Keiki.

2-5 Capacity of control transformer

- Use an auto-transformer of the rated capacity as the control transformer.

3 Main Circuit

3-1 Main circuit connection

- Select wires to be connected which have proper current capacity.
- Exercise caution so that no stress works on the terminals.

3-2 Arcing space

- When installing the transfer switch, be sure to provide arcing space as indicated in "Overall Dimensions". Arc, when it comes in contact with any other device or metal body at the time of breaking, can cause accidents.

4 Manual Operation of the LEF Type

- Manual operation of the transfer switch is to be performed only for purposes of checks or maintenance. Manual operation can be done when there is no difference in phase, voltage and frequency between the two power supply systems. (Be sure to turn off power to the control circuit, however.)
- Never conduct manual operation the transfer switch is being energized under conditions other than the above.

Features

- Small size and light weight
- Mounting dimensions identical to those of our E or NE type
- Control circuit and main circuit housed in a casing
- Terminal covers provided for control circuit and main circuit (Terminal cover for main circuit: Front type only)
- A wide range of models to select from for your applications

Types

- LEF Type: Overlap transfer switch for time-fixed power supply switching
- LEH Type: Overlap manual contactor for power supply switching

Model Selection & Designation

Standard model (Models immediately available to order)

Semi-standard model (Models produced on standard lines and so available in short lead time)

Rated voltage	Rated current	Type	No. of poles		Connection type	Throw	Auxiliary circuit (auxiliary contacts)	Option	
			2 P	3 P	4 P	Front

Example of Designation		6	1	LEF	-	3 F D - A200/A200 - 2 - HD			
Rated voltage		Rated current	Type	No. of poles	Connection type	Throw	※Coil voltage (200VAC on A power supply side) (200VAC on B power supply side)	Auxiliary contacts (2a2b)	
								Option (Handle holder, Test record)	
Nameplate marking				※No designation necessary for LEH type, which is a manual contactor.					

Standard accessories

- Operation handle
- Control circuit terminal cover
- Hand holder (LEH type only)
- Main circuit terminal cover (Front only)
- Main circuit terminal bolt (400A or below)

NOTES 1. Standard control coil voltages are 100/110VDC, 100/110VAC and 200/220VAC.

Other voltages are available to individual orders.

2. Even with the back connection type, front wiring is used for the control circuit and auxiliary circuit.

1 Rated Specifications

Note: The LEH type, which is for manual switching, does not require control power supply.

Weight values in () represent those for the LEH type.

(LEF type 600 to 1600A / Front)
(LEH type 600 to 1600A / Front)

- ① Control circuit terminal block (M3.5)
 - ② A power supply closing marking
 - ④ Overlap marking
 - ⑤ Manual closing handle hole
 - ⑦ A power supply overlap operation hole
 - ⑩ Auxiliary circuit terminal (M4)
 - ⑬ Load main circuit terminal
- ③ B power supply closing marking
 - ⑥ Model nameplate
 - ⑧ B power supply overlap operation hole
 - ⑪ A power supply main circuit terminal
 - ⑫ B power supply main circuit terminal
 - ⑯ Earth terminal

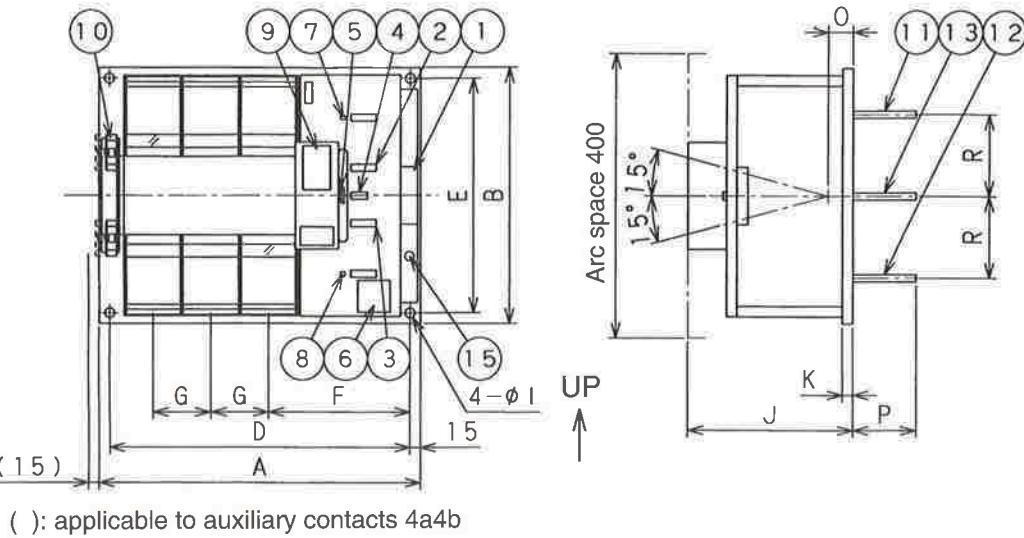

Note) The LEH type has no control circuit terminal block ①
